

Profile & Portfolio System

A brief, organized strategy for LinkedIn, GitHub, website, social media, CVs, and freelance profiles

Core idea: build one central professional home, then use each platform for a specific purpose. Do not copy the same content everywhere.

Career Presence System

One central home, many platform-specific doors

Recommended center: personal website

Put all software and non-software projects there. Use GitHub for code, YouTube for demos, LinkedIn for discovery, and Notion/Airtable as your private project database.

1. The system in one page

Personal website

Main public portfolio: all projects, case studies, CV/resume, demos, and contact links.

LinkedIn

Recruiter and professional discovery. Show your headline, featured projects, experience, and credibility.

GitHub

Technical proof. Use it for clean repositories, READMEs, code structure, reproducibility, and pinned projects.

YouTube

Demo proof. Short project walkthroughs often explain your work better than code alone.

X / Facebook

Networking and visibility. Share learning notes, project updates, and join relevant communities.

Upwork / Freelancer

Client acquisition. Do not show everything; show service-specific proof that solves client problems.

Best project location

Use a personal website as the public home for everything. Use Notion, Airtable, or Google Sheets as the private inventory where you track all projects before publishing the strongest ones.

2. Where every project should live

Where to Put Every Project

Use one private inventory, then publish only the best public proof.

Project categories to use on your website

- **AI / ML**
Models, notebooks, deployed APIs, prediction systems
- **LLM / RAG**
Chatbots, document assistants, agents, retrieval systems
- **Healthcare / clinical**
Anonymized learning systems, case logs, workshops
- **Data analysis**
SQL, dashboards, reports, KPI analysis
- **Software**
APIs, apps, automation tools, websites
- **Business / non-software**
Presentations, events, operations, volunteering, writing

3. Resume, CV, and cover letter system

Master CV

Private full record of all experience, projects, courses, achievements, and non-software work.

Targeted resume

1-2 page version customized for AI/ML, Data Science, Data Analyst, LLM Engineer, or freelance work.

Cover letter

Short argument for one role: why company, why role, why you, and what proof you bring.

Project bullets

Use: Built [thing] to solve [problem] using [tools], resulting in [output/impact].

Simple rule

Your website proves breadth. Your resume proves relevance. Your cover letter proves fit. Your freelancing profile proves you can solve a client problem quickly.

4. First setup checklist

- Create a master project inventory in Notion, Airtable, Google Sheets, or Markdown.
- Choose 5-8 projects to feature publicly. Include at least one non-software project if it proves leadership, healthcare, communication, or business thinking.
- Buy a simple domain or prepare a free portfolio site. Suggested pages: Home, Projects, Resume, Writing/Demos, Contact.
- Clean GitHub: pin only strong repositories and improve each README.
- Update LinkedIn: headline, About section, Featured section, top projects, and website link.
- Record 2-3 short YouTube demos for the best technical projects.
- Create freelancing profiles around services, not identity. Example: data dashboards, Python automation, RAG assistant, ML prediction model.

Final recommendation

Put all projects in one central personal website. Keep a private Notion/Airtable project database behind it. Use GitHub for code, YouTube for demos, LinkedIn for discovery, and freelancing websites for client-focused proof.
